

CPEN 400Q

# Lecture 11: an overview of quantum compilation

Monday 12 February 2024

# Announcements

- Quiz 4 today
- Literacy Assignment 1 due Tuesday at 23:59
- Assignment 2 due Thursday at 23:59
- Project details available on PrairieLearn
- Wednesday is hands-on class

# Final project details

Implement the methods of a recent research paper and reproduce the results as closely as possible.

Four parts:

- (15%) Midterm checkpoint (write up + short meeting)
- (40%) Companion report
- (40%) Software implementation
- (5%) Weekly peer assessment surveys

Work in groups of 4.

# Final project: important dates

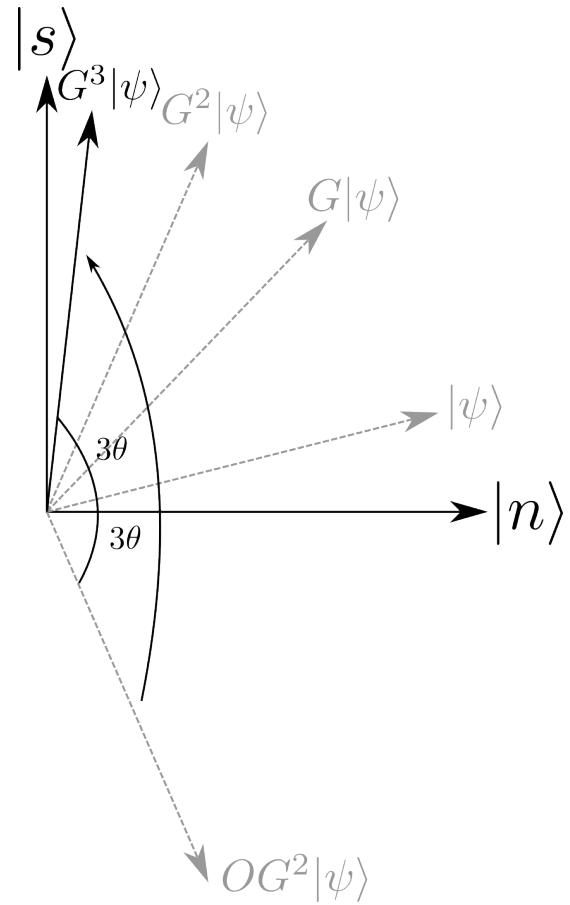

- **2024-02-16:** Group and topic selection due.
- **2024-03-01:** First weekly survey due
- **2024-03-06 - 2024-03-08:** Midterm checkpoint
- **2024-04-12:** Final report and software implementation due.

# Announcements

- Quiz 4 today
- Literacy Assignment 1 due Tuesday at 23:59
- Assignment 2 due Thursday at 23:59
- Project details available on PrairieLearn
- Wednesday is hands-on class

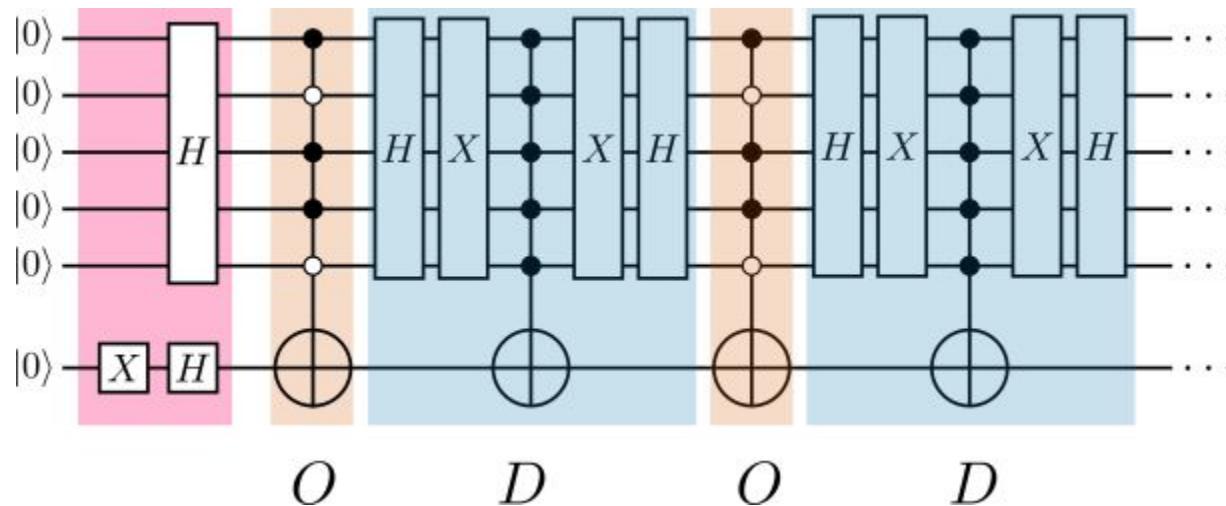

# Last time

We discussed how Grover search of an unstructured space has a square-root speedup in **query complexity** over classical methods.

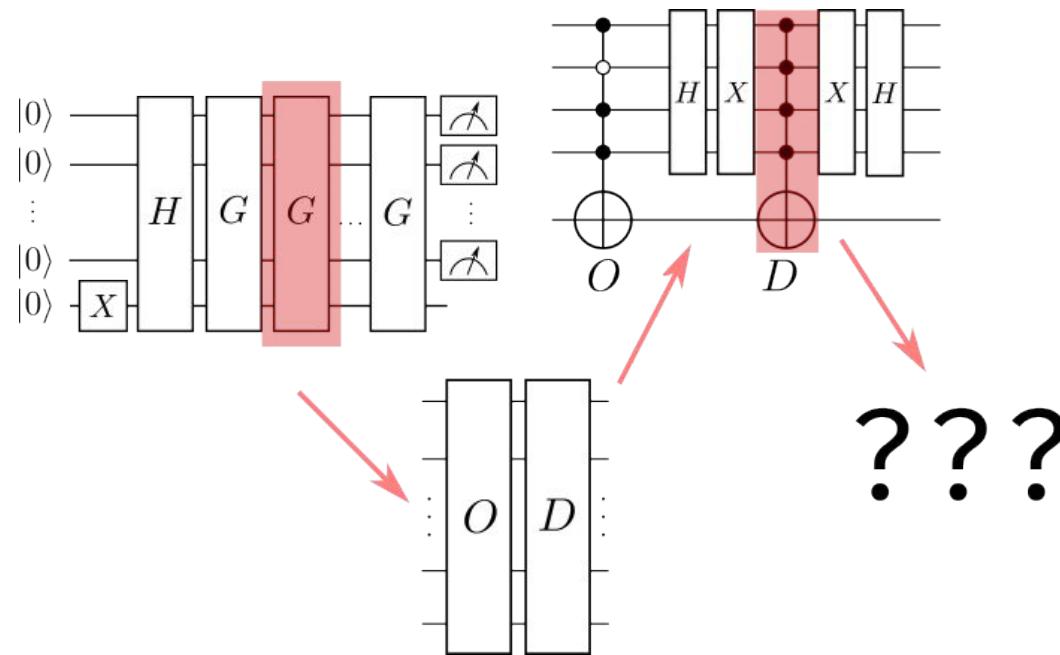

# Last time

We implemented Grover's algorithm in PennyLane.

# Last time

We finished off with this picture:

# Today

Learning outcomes:

- explain the limitations of query complexity as a metric
- estimate the actual resources (width, depth, gate count) required to run quantum circuits
- define what it means for a gate set to be universal, and list some key sets
- draw and identify the different parts of the compilation stack

QPU

# This lecture

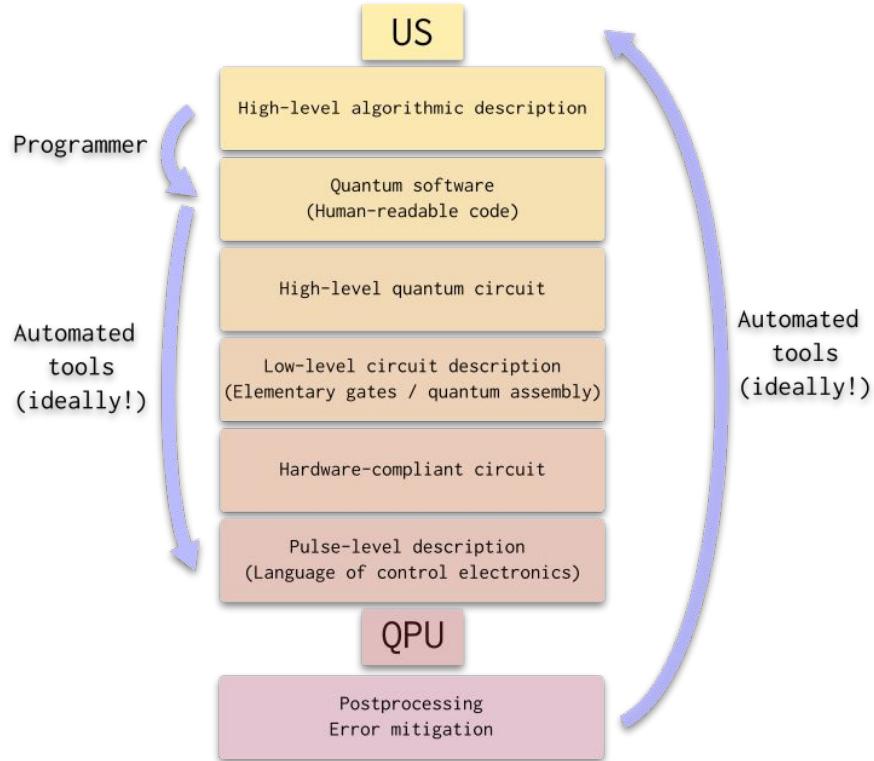

What happens in between?

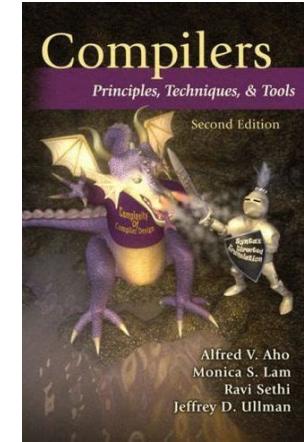

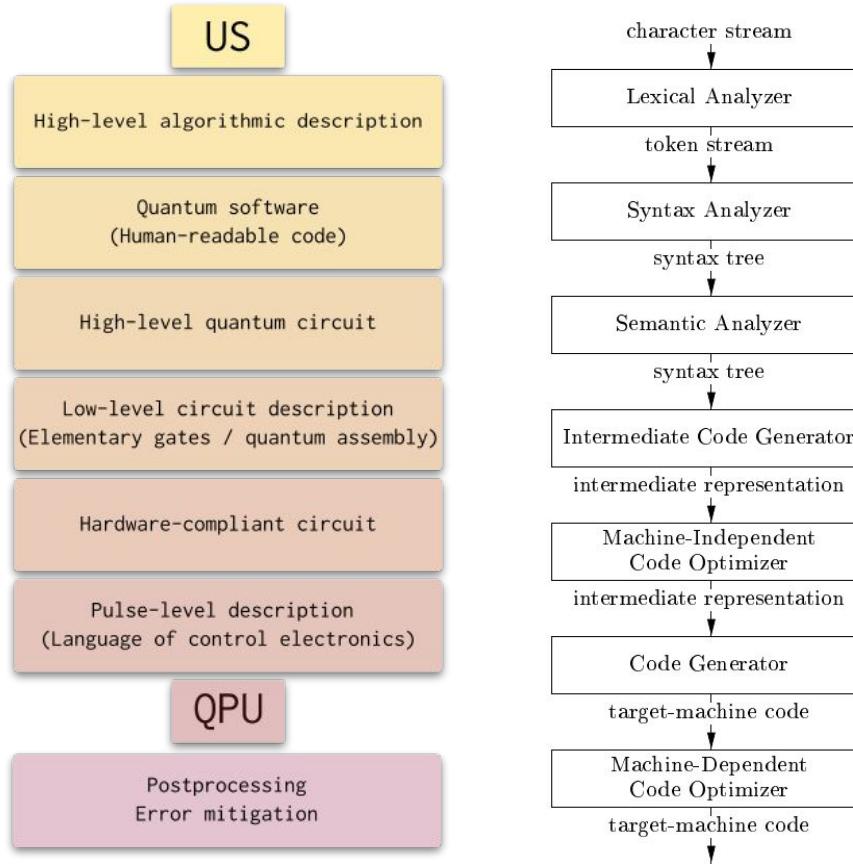

# The quantum compilation stack

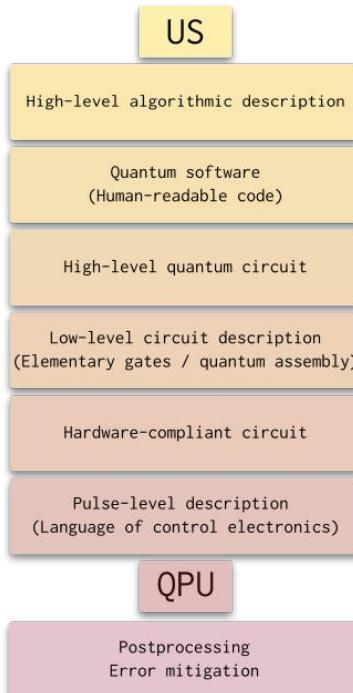

# The quantum compilation stack

# The quantum compilation stack

# Compilation

Implemented as a sequence of modular *passes*, or *transforms*, that modify a circuit in various ways.

Loosely divided into 3 stages:

- decomposition and synthesis
- hardware-independent optimization
- hardware-dependent optimization

# Compilation: key metrics

US

High-level algorithmic description

QPU

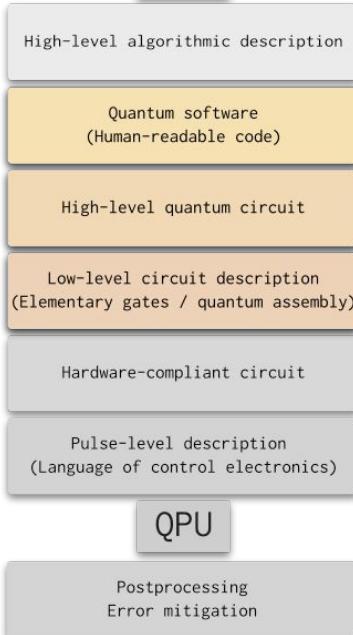

Postprocessing  
Error mitigation

We want the circuits we implement to be as efficient as possible with respect to:

- Circuit width (number of qubits)
- Circuit depth (length of longest path)
- 1- and 2-qubit gate count

# Circuit synthesis

US

Given:

- arbitrary unitary matrix  $U$
- a finite set of gates  $\{G_k\}$
- a target precision,  $\epsilon$

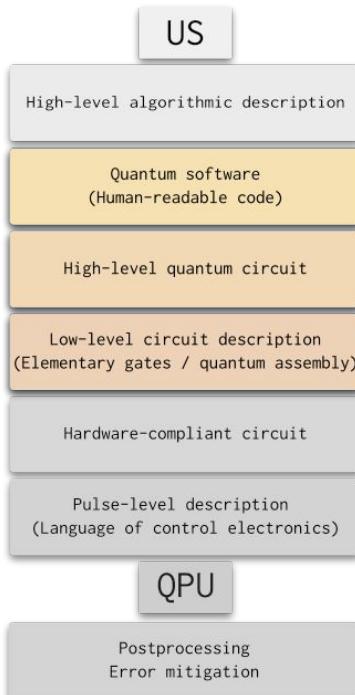

Find

$$U' = C_1 C_2 \cdots C_m$$

s.t.

$$\|U - U'\| < \epsilon, C_i \in \{G_k\}$$

# Circuit synthesis: universal gate sets

A  $\{G_k\}$  for which this can be done is called a **universal gate set**.

For a single qubit:

- Any two Pauli rotations (exact)
- Hadamard and T (approximate)

Theoretical bound:  $O(\log^c(1/\epsilon))$  gates,  $c$  varies from 1-4 depending on assumptions.

# End-to-end example

Compile and optimize this circuit so it can run on a trapped-ion processor.

# End-to-end example

The native gate set used by some trapped-ion processors (e.g., IonQ) is

$$GPI(\phi) = \begin{pmatrix} 0 & e^{-i\phi} \\ e^{i\phi} & 0 \end{pmatrix}$$

$$GPI2(\phi) = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & -ie^{-i\phi} \\ -ie^{i\phi} & 1 \end{pmatrix}$$

$$MS = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 0 & 0 & -i \\ 0 & 1 & -i & 0 \\ 0 & -i & 1 & 0 \\ -i & 0 & 0 & 1 \end{pmatrix}$$

\*MS is actually a parametrized gate in general, but only this fixed-parameter version is implemented in hardware.

# Software usage

Many general-purpose packages contain preset passes, and the ability to create your own.

```
qiskit_circuit = QuantumCircuit(...)

transpiled_circuit = transpile(
    qiskit_circuit,
    optimization_level=3,
    coupling_map=[],
    layout_method="sabre"
)
```

```
@qml.qnode(dev)
@expand_rot_and_remove_zeros
@qml.compile(pipeline=[
    qml.transforms.cancel_inverses,
    qml.transforms.single_qubit_fusion(),
    qml.transforms.commute_controlled(direction="left"),
    qml.transforms.merge_rotations()
], num_passes=3)
def tapered_circuit_simplified(params):
    for wire in dev.wires:
        if hf_state_tapered[wire] == 1:
            qml.PauliX(wires=wire)
```

See also: Cirq, TKET, staq, XACC, and more.

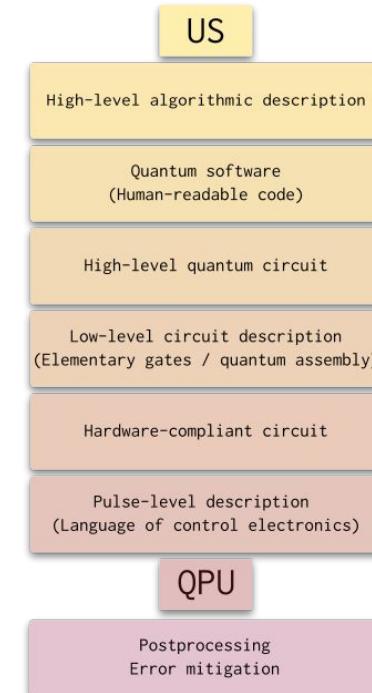

# Challenge

~~Problem:~~ many things are (computationally) hard

Many parts of the stack still require expert input and tailored design.

Need automation to scale up to (multi-QPU) devices w/1000s of qubits:

- circuit synthesis
- circuit optimization
- mapping, routing, and scheduling
- noise-aware techniques
- verification and debugging

# Next time

Content:

- Hands-on with quantum compilation (write your own transforms)

Action items:

- A2 and Lit A1
- Choose paper and post project group details to Piazza

Recommended reading:
